

GraphQL	Java	JavaScript (or TypeScript)
<b>input</b> (SDL keyword)	<code>@InputOnly public final class</code>	prototypical type, prototype
<b>type</b> (SDL keyword)	<code>@OutputOnly public final class</code>	prototypical type, prototype
<b>interface</b> (SDL keyword)	<code>@OutputOnly interface</code>	~one of prototype's prototypes
<b>union</b> (SDL keyword)	Approximately an empty marker interface implemented by relevant classes.	n/a, unions in TypeScript
“field” In a query In a mutation In a subscription	method (call)  Non-void, no side-effects Non-void with side-effects Void notification control	prototypical function (call)  returning something, no side-effects returning something, w/ side-effects no return, notification control
<b>query</b> (root field)	Predefined, named, statically imported singleton of the <b>Query</b> type.	Predefined, named, singleton of the <b>Query</b> type.
<b>Query</b> (built-in type)	The class of the <b>query</b> singleton.	The prototype of the <b>query</b> singleton.
<b>mutation</b> (root field)	Predefined, named, statically imported singleton of the <b>Mutation</b> type.	Predefined, named, singleton of the <b>Mutation</b> type.
<b>Mutation</b> (built-in type)	The class of the <b>mutation</b> singleton.	The prototype of the <b>mutation</b> singleton.
<b>subscription</b> (root field)	Predefined, named, statically imported singleton of the <b>Subscription</b> type.	Predefined, named, singleton of the <b>Subscription</b> type.
<b>Subscription</b> (built-in type)	The class of the <b>subscription</b> singleton.	The prototype of the <b>subscription</b> singleton.
“scalar” (built-in)  Boolean Int Float String ID	boxed (nullable) primitive type  <code>Boolean</code> <code>Integer</code> <code>Double</code> <code>String</code> <code>~ Integer or UUID or String</code>	primitive type  <code>Boolean</code> <code>~ Number (32-bit int subset)</code> <code>Number</code> <code>String</code> <code>~ Number or String</code>
<b>scalar</b> (keyword)	Custom primitive-like value type that can be represented using one of the primitive type literals in JSON.	
<b>enum</b>	<b>enum</b>	n/a, <b>enum</b> in TypeScript
<b>directive</b>	annotation, without runtime retention (not reflectable)	n/a, decorators in TypeScript
argument	method or annotation parameter and/or argument	Function or decorator (TypeScript) parameter and/or argument
variable	request method argument	request function argument
!	<b>@NonNull / @NotNull</b>	n/a, <b>NonNullable</b> in TypeScript
{	<code>.map(_ -&gt; new JsonObject&lt;&gt;() {</code>	<code>.map((_) =&gt; {</code>
introspection	reflection	reflection
error	exception, throwable or error	exception
